## *Editorial*

56<sup>th</sup> National Pharmacy Week has been celebrated throughout India during 19<sup>th</sup> – 25<sup>th</sup> November 2017 with a theme- **“Know Your Medicines: Ask Your Pharmacist”**. The theme was appropriately chosen by Indian Pharmaceutical Association. Pharmacists have made outstanding contributions to the pharmaceutical profession since its inception to develop Pharmaceutical Research, Education and Industry. Indian Pharmaceutical Industry is now known as **“Pharmacy of the Globe”** due to its magnificent growth and export potential. Presently this Industry exports to more than 250 countries including developed countries apart from making India self reliant in terms of medicine formulation. Presently we have more than 10 lakh community pharmacies reaching out medicines to different parts of our country, but there is still much scope to improve the quality of services of the community pharmacies. IPA has requested Principal Secretaries and Drugs Controllers of all states for speedy implementation of Pharmacy Practice Regulation 2015. It is expected cooperation from them in this matter for improving the health care system of our country. Over the last 10-15 years, a number of steps have been taken by IPA, which include conducting- GPP Training jointly with WHO, signing MOU between RNTCP-Govt. of India and IPA, development of a training Module jointly by RNTCP and IPA etc. IPA is representing as a member of the National working Group of the PvPI contributing to developing a Pharmacovigilance system in our country and PvPI has made significant contribution in the issue of safety of the drugs available in the market and now PvPI has earned the distinction of being a WHO collaborating centre. IPA has taken a multipronged approach to fight against the Antimicrobial Resistance (AMR) and is working for the last few years, Bengal branch is a major contributor of this activity. We are determined to continue our activities further for improving access to medicines.

**New Drug: Tenofovir Alafenamide tablets, for oral use(First approved by FDA in the brand name VEMLIDY)**

**WARNING:** LACTIC ACIDOSIS/SEVERE HEPATOMEGALY WITH STEATOSIS and POST TREATMENT SEVERE ACUTE EXACERBATION OF HEPATITIS B See full prescribing information for complete boxed warning. • Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported with the use of nucleoside analogs. (5.1) • Discontinuation of anti-hepatitis B therapy may result in severe acute exacerbations of hepatitis B. Hepatic function should be monitored closely in patients who discontinue VEMLIDY. If appropriate, resumption of anti-hepatitis B therapy may be warranted.

**INDICATIONS AND USAGE:** VEMLIDY is a hepatitis B virus (HBV) nucleoside analog reverse transcriptase inhibitor and is indicated for the treatment of chronic hepatitis B virus infection in adults with compensated liver disease.

**DOSAGE AND ADMINISTRATION:** • Testing: Prior to initiation of VEMLIDY, test patients for HIV infection. VEMLIDY alone should not be used in patients with HIV infection. Assess serum creatinine, serum phosphorous, estimated creatinine clearance, urine glucose, and urine protein before initiating VEMLIDY and during therapy in all patients as clinically appropriate. (2.1) • Recommended dosage: 25 mg (one tablet) taken orally once daily with food. (2.2) • Renal Impairment: VEMLIDY is not recommended in patients with estimated creatinine clearance below 15 mL per minute. (2.3) • Hepatic Impairment: VEMLIDY is not recommended in patients with decompensated (Child-Pugh B or C) hepatic impairment.

**DOSAGE FORMS AND STRENGTHS:** Tablets: 25 mg of tenofovir alafenamide.

**WARNINGS AND PRECAUTIONS:** • HBV and HIV-1 coinfection: VEMLIDY alone is not recommended for the treatment of HIV-1 infection. HIV-1 resistance may develop in these patients. (5.3) • New onset or worsening renal impairment: Assessment of

serum creatinine, serum phosphorus, estimated creatinine clearance, urine glucose, and urine protein is recommended before initiating VEMLIDY therapy and during therapy as clinically appropriate.

**ADVERSE REACTIONS:** Most common adverse reactions (incidence greater than or equal to 5%, all grades) are headache, abdominal pain, fatigue, cough, nausea, and back pain. (6.1) To report SUSPECTED ADVERSE REACTIONS, contact Gilead Sciences, Inc. at 1-800-GILEAD-5 or FDA at 1-800-FDA-1088 or [www.fda.gov/medwatch](http://www.fda.gov/medwatch).

**DRUG INTERACTIONS:** VEMLIDY is a substrate of P-glycoprotein (P-gp) and BCRP. Drugs that strongly affect P-gp and BCRP activity may lead to changes in VEMLIDY absorption. Consult the full prescribing information prior to and during treatment for potential drug-drug interactions.

**Status in India:** Tenofovir Alafenamide Fumarate bulk & 25 mg capsules was approved by the CDSCO for the treatment of chronic Hepatitis B virus infection in adults with compensated liver disease on 10.11.2017.

**Hyoscine butylbromide ampoule Caution of use in patients with pre-existing cardiac conditions**

The Therapeutic Goods Administration (TGA) has updated product information for hyoscine butylbromide (Buscopan®) to include a caution regarding the use of hyoscine ampoules in patients with pre-existing cardiac conditions (for example cardiac failure, coronary heart disease). The Australian product information for hyoscine butylbromide already lists tachycardia, decreased blood pressure and anaphylaxis as potential adverse effects, but the product information has been updated to include a stronger warning in the precautions section because these adverse events can be more serious in patients with cardiac conditions. Monitoring of these patients is advised and

emergency equipment and personnel trained in its use must be readily available. Hyoscine butylbromide ampoules, administered by intramuscular or slow intravenous injection, are used to treat gastrointestinal tract, biliary and renal spasms, and are used as a diagnostic in radiology. There are 28 cases describing tachycardia and/or hypotension relating to use of hyoscine butylbromide in the TGA's adverse events database. An additional four cases describe anaphylactic reactions. There is insufficient clinical information provided to determine whether or not these reactions occurred in people with pre-existing cardiac conditions. None of these cases reported death, cardiac arrest or myocardial infarction.

### **Palivizumab Risk of thrombocytopenia**

The MHLW and the PMDA have announced that the package insert for palivizumab (Synagis®) has been updated to include the risk of thrombocytopenia as a clinically significant adverse reaction. Palivizumab is indicated for: prevention of serious lower respiratory tract diseases caused by respiratory syncytial virus infection in high-risk neonates and infants and children. A total of four cases associated with thrombocytopenia have been reported in Japan. Of these, a causal relationship could not be excluded in one case.

Reference: Revision of Precautions, MHLW/PMDA, 12 September 2017 ([www.pmda.go.jp/english/](http://www.pmda.go.jp/english/))

### **Warfarin Risk of calciphylaxis**

The MHLW and the PMDA have announced that the package insert for warfarin has been updated to include the risk of calciphylaxis as a clinically significant adverse reaction. Warfarin is used for treatment and prevention of thromboembolism (including venous thrombosis, myocardial infarction, pulmonary embolism, brain embolism and, slowly progressive cerebral thrombosis). Eleven

cases associated with calciphylaxis have been reported in Japan and there is an overseas report published in the literature describing calciphylaxis with the use of warfarin. In addition, package inserts in Europe and the United States have been revised.

Reference: Revision of Precautions, MHLW/PMDA, 8 August 2017 ([www.pmda.go.jp/english/](http://www.pmda.go.jp/english/)) (See WHO Pharmaceuticals Newsletters No.2, 2017: Risk of calciphylaxis in Malaysia and No.4, 2016: Reports of calciphylaxis in the US)

### **Teriflunomide Potential risk of acute renal injury or nephrolithiasis: not enough evidence**

Health Canada has reviewed the potential risk of sudden onset of acute renal injury or nephrolithiasis with the use of teriflunomide (Aubagio®) following safety information received from the manufacturer. Teriflunomide is used to treat patients with multiple sclerosis (MS). At the time of the review, Health Canada received, 55 reports (all were international) of suspected sudden onset of kidney injury and 135 reports (eight of these were Canadian) of suspected nephrolithiasis with teriflunomide use from the manufacturer. No additional reports were found in Health Canada's Vigilance database. Upon review, only two reports of patients with sudden onset of renal injury were considered to be possibly related to the use of teriflunomide. The review of reports of nephrolithiasis did not show a link related to the use of teriflunomide. In these reports, other factors could have played a role, such as the MS itself or problems with the bladder. In addition, information in the reports that described the health of the patient's kidneys before taking teriflunomide was limited. In the published scientific literature, there were no reports or studies related to the possible association of sudden onset of renal injury or nephrolithiasis with the use of teriflunomide. There was limited evidence to suggest that MS patients may be at greater risk of renal injury or nephrolithiasis when taking teriflunomide. Health Canada's review of the available information did not establish a link

between the use of teriflunomide and a risk of sudden onset of renal injury or nephrolithiasis.

### **CCI starts probe on alleged price fixing of key anti diabetic drugs**

Competition Commission of India has initiated an investigation on drug makers Abbott, Novartis, Emcure Pharma and USV Pvt Ltd over alleged price fixing of the blockbuster anti-diabetic drug Vildagliptin, people aware of the development said.

The fair play regulator has sent notices to the four drug makers, asking them for trade details of this drug in an attempt to find out if the companies colluded with each other to keep the price of the drug at certain levels, they said. Competition Commission of India (CCI) is also looking at the involvement of senior executives from these companies over price fixing, sources said.

Vildagliptin, sold under the brand name Galvus, is a proprietary drug of Novartis that comes under the new class of antidiabetic drugs known as DPP 4 inhibitors. These drugs are prescribed for patients with Type 2 diabetes and are considered to be far more effective in controlling blood glucose level compared to the older class of drugs. Novartis, which reported revenues worth Rs 397 crore this year for this drug, has licensed

### **Forthcoming Events:**

the marketing rights to Abbott, Emcure and USV. This year, the combined brand of Vildagliptin recorded a sales worth Rs 790 crore, in the Rs 2,600-crore gliptin market.

The whistle-blower had reached out to several Indian regulators in February alleging that Novartis controls the pricing structure for Vildagliptin and that is followed by the other license holders, where the drug prices are matched to the lowest decimal. Though there is no written communication between partners, these companies also synchronise every price change, the person alleged. To back these claims, the whistle-blower had sent a chart that listed the various dosage size of these brands, and all of them were priced in the same range. Price cartelisation is prohibited under the Competition Act, 2002.

Antitrust lawyers that ET spoke to said that though cartel enforcement has been a focus of CCI since the beginning, it has taken time to gain traction.

Estimates suggest that CCI has investigated several cases of cartels (including in pharmaceuticals sector), imposing a fine of more than Rs 7,500 crore on various companies and their officers.
